

A kill switch must stop effects, not dashboards

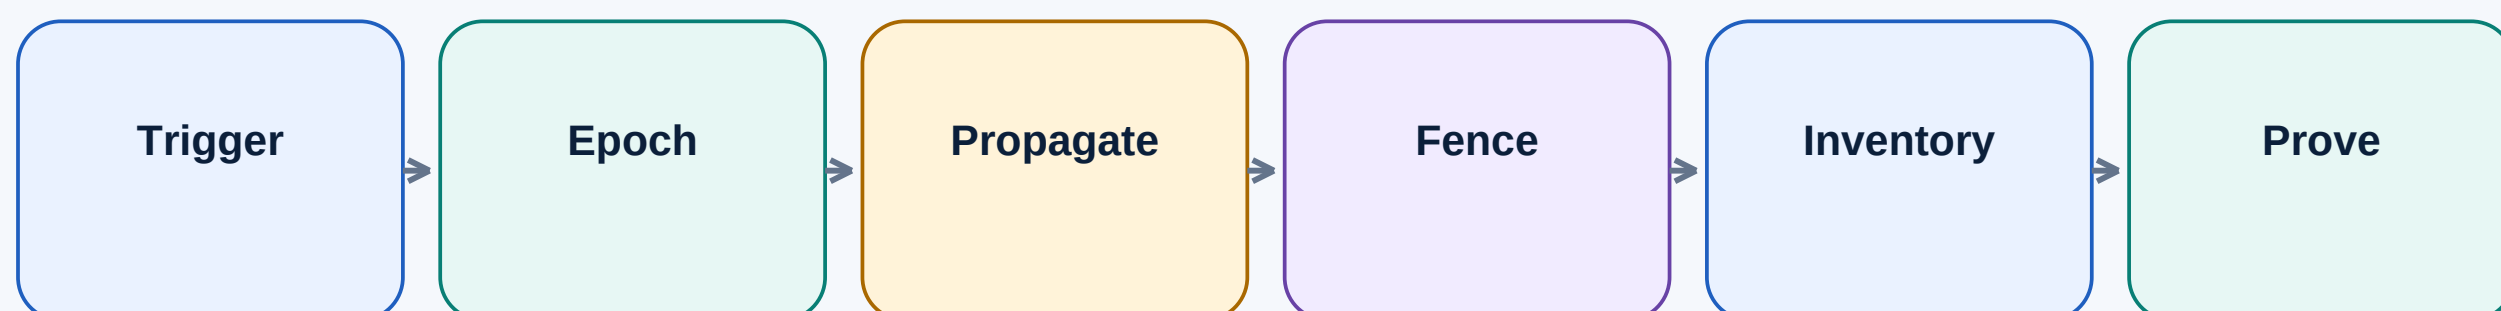

Fast command acceptance is irrelevant if stale authority still commits.

THE OPERATING NUMBER

200 ms $\neq$ containment

A responsive API can coexist with minutes of continued business exposure

CONTROL PATH

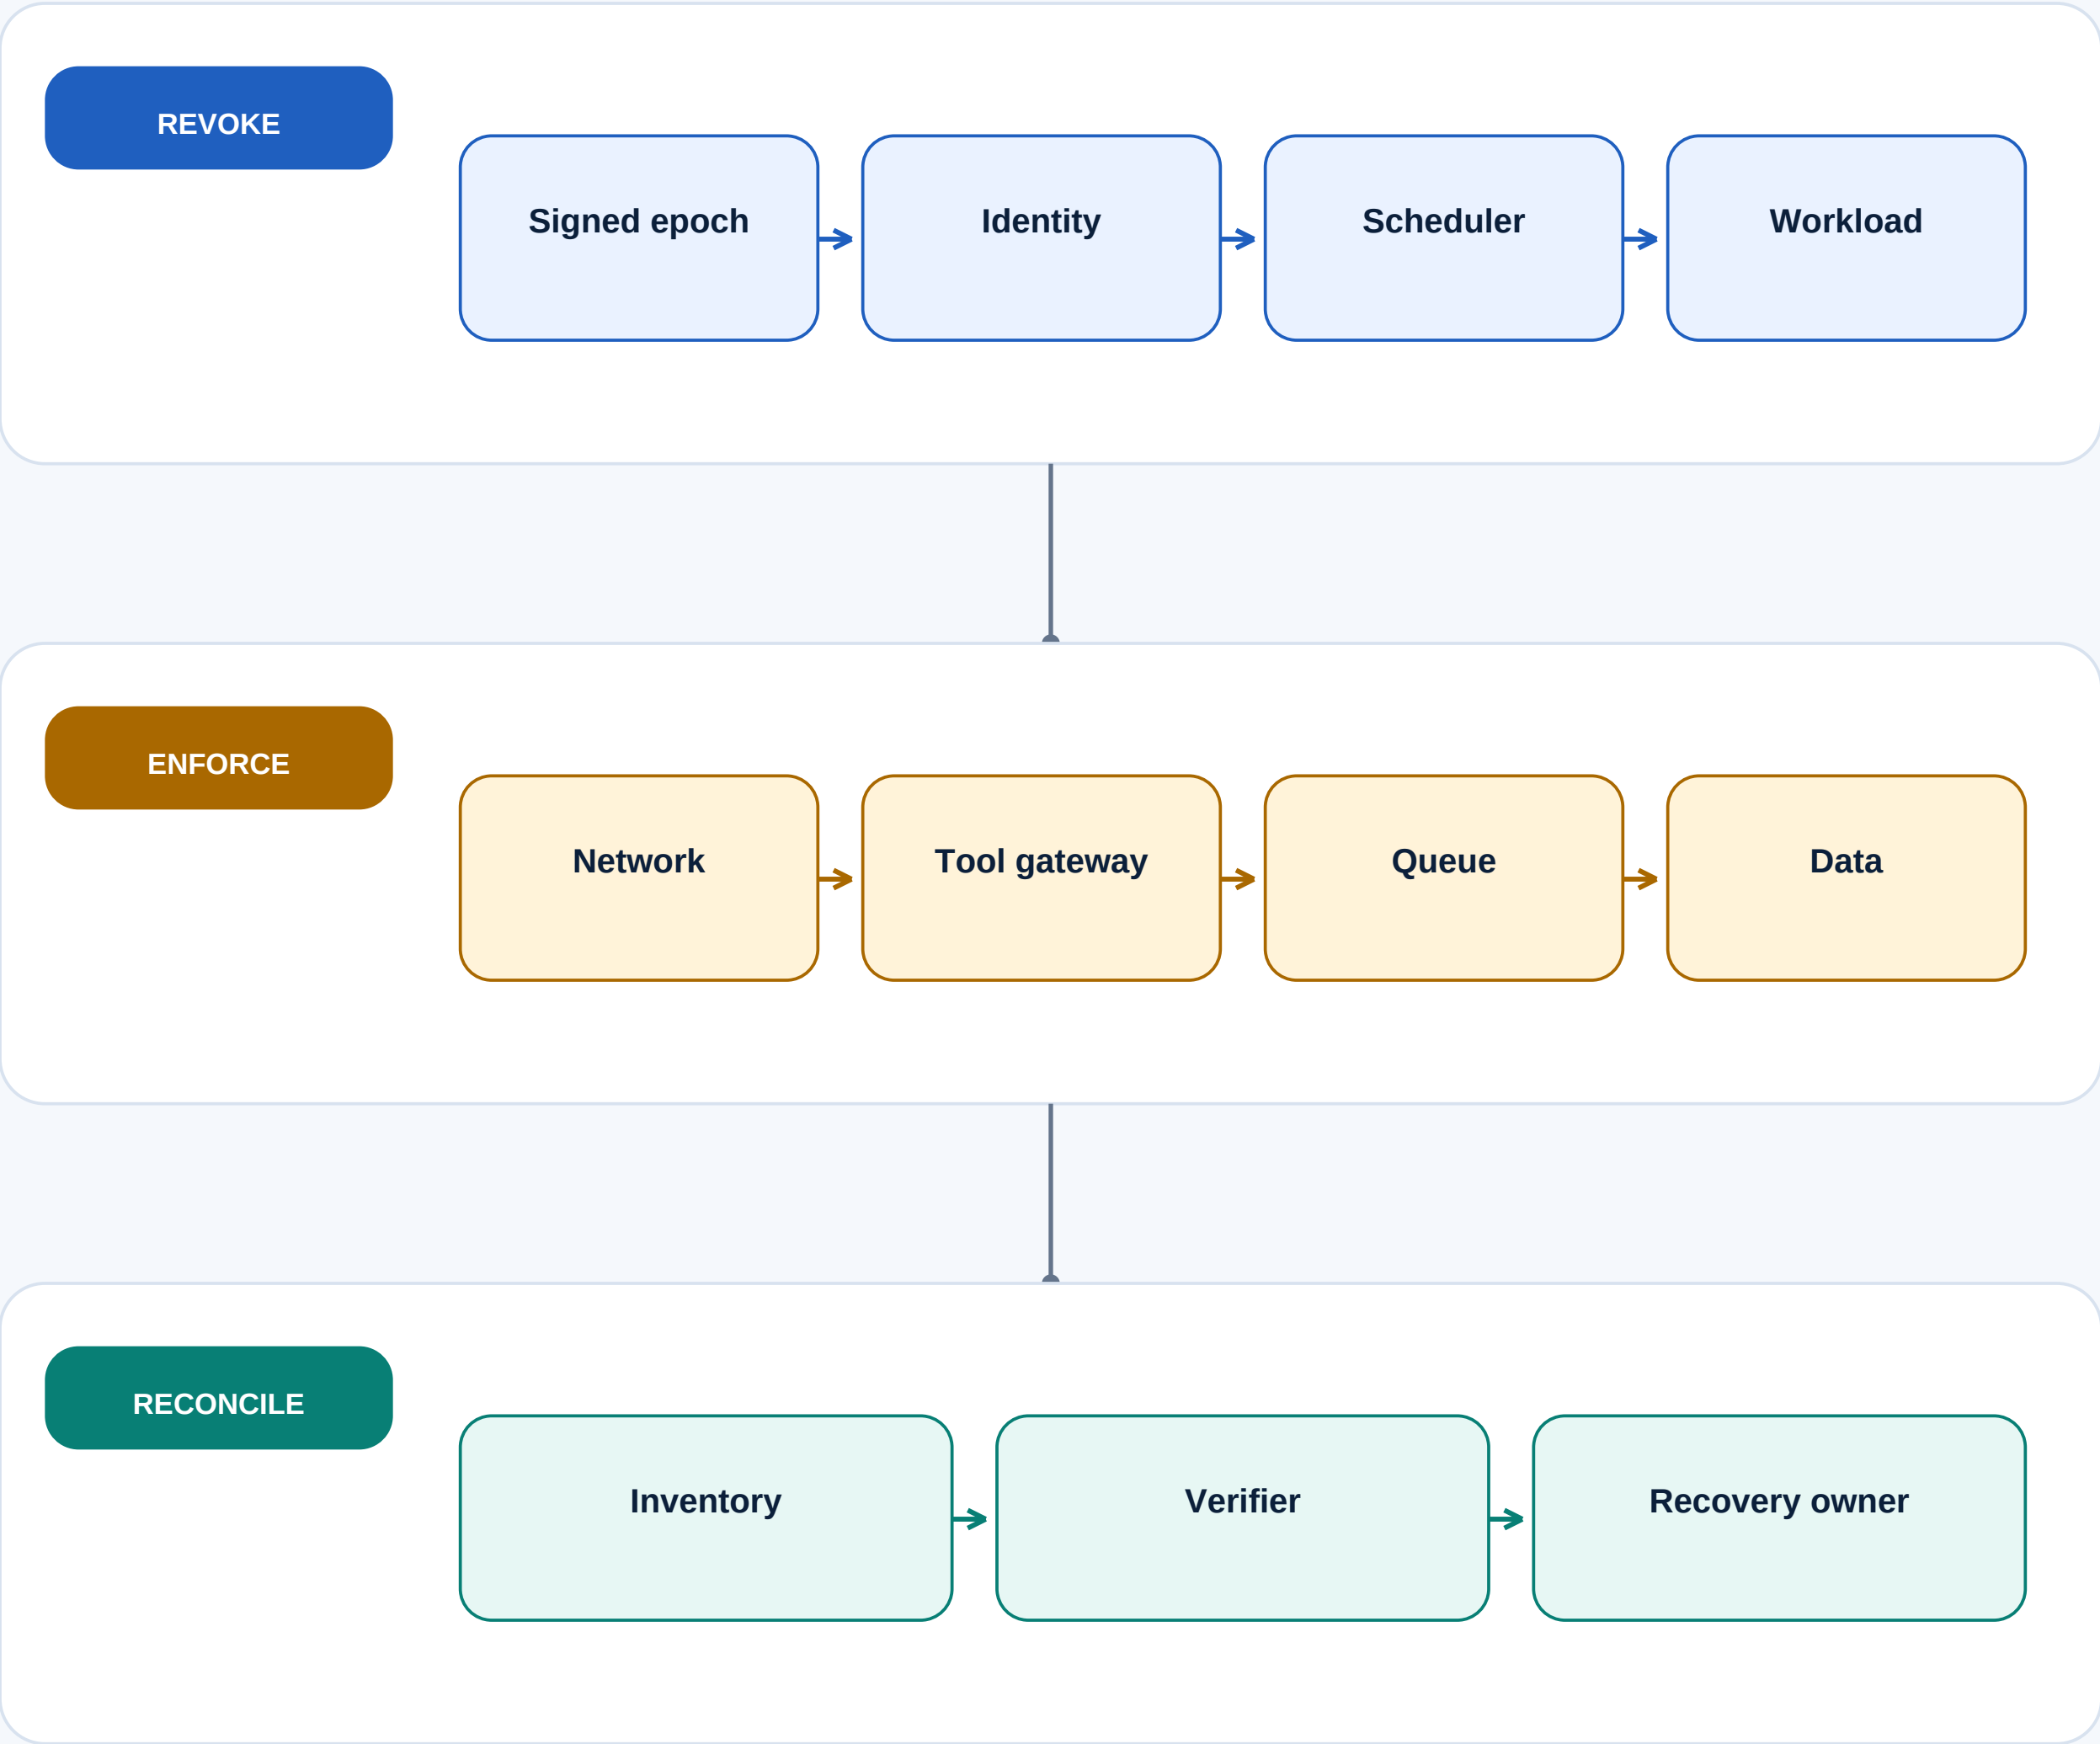

DESIGN PRINCIPLE

Stopping new authority and establishing business truth are different clocks.

Containment control architecture

Explicit planes separate decision, authority, execution and proof.

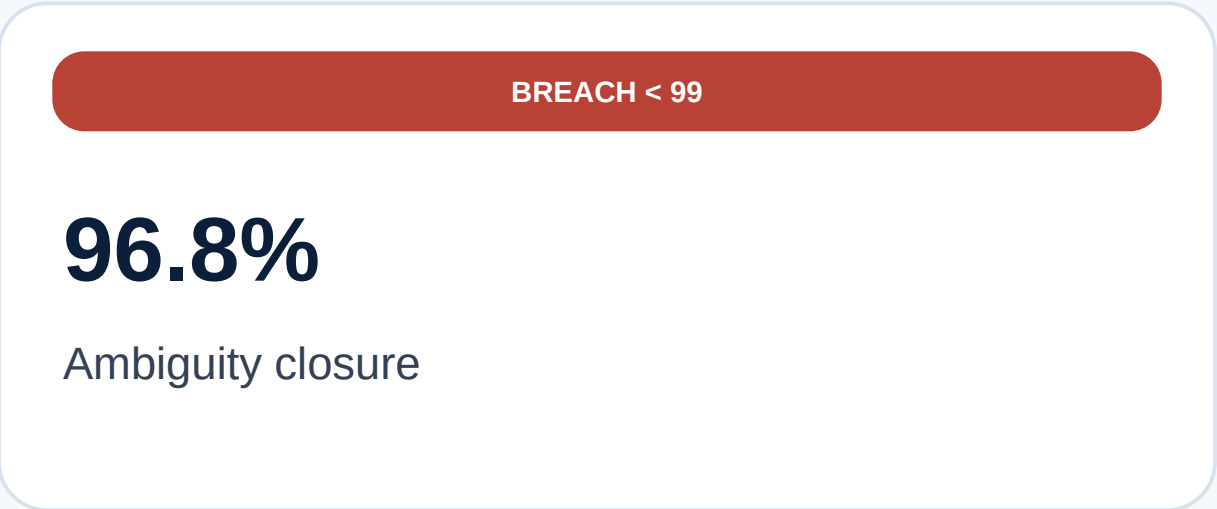

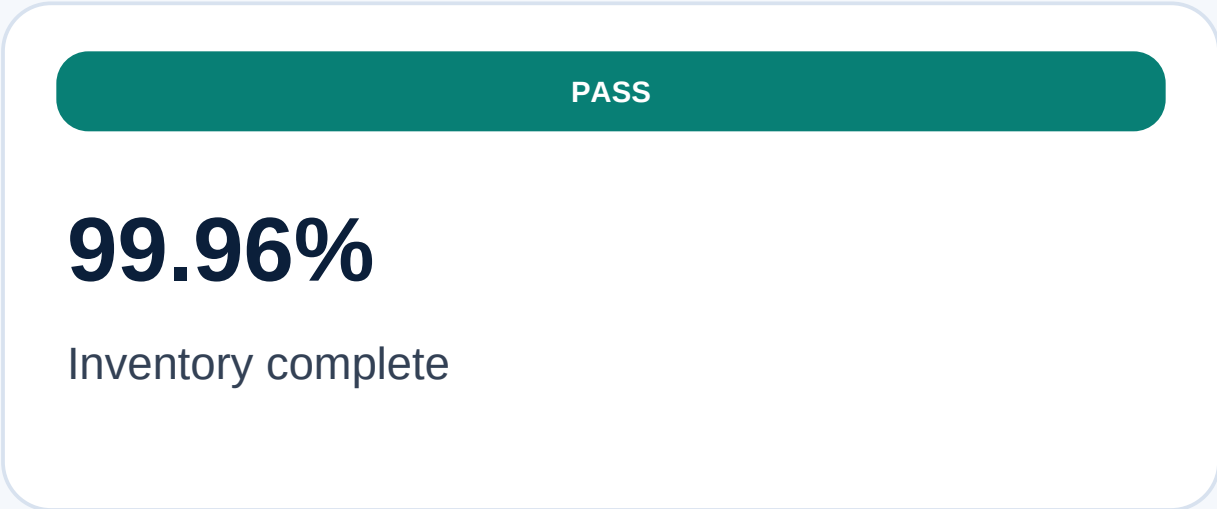

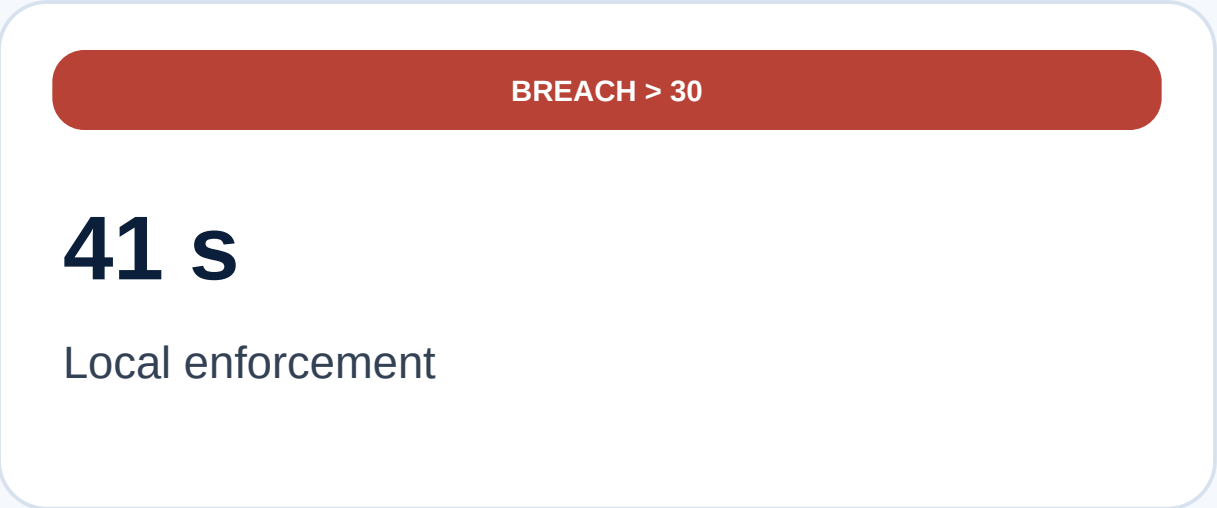

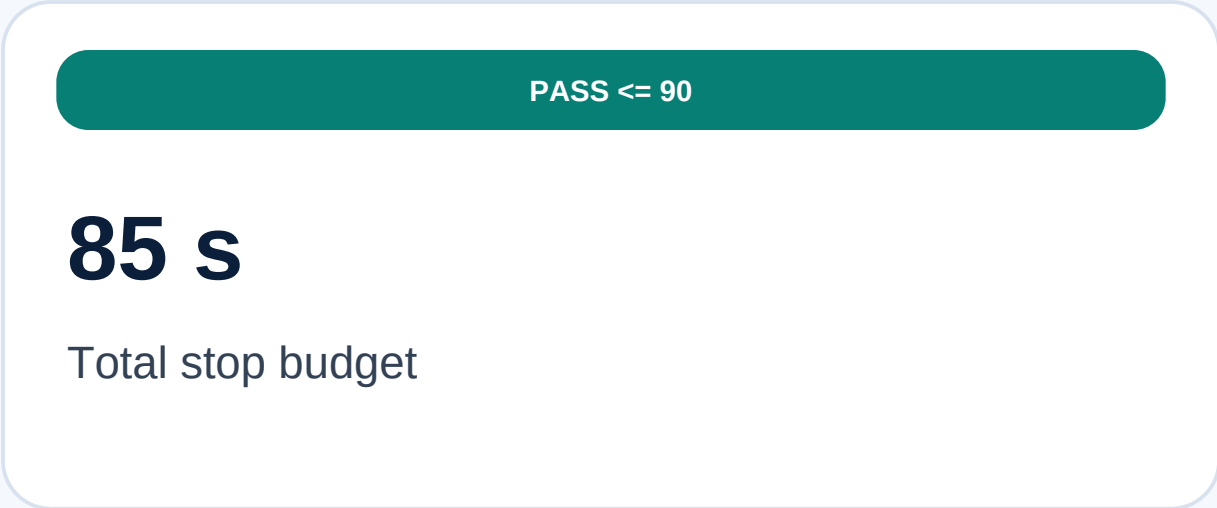

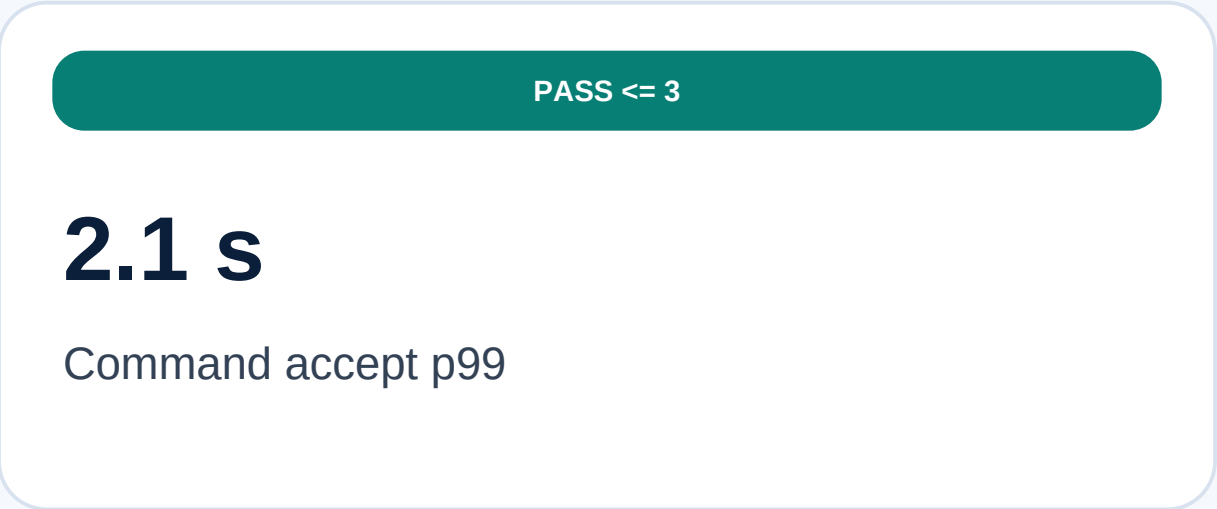

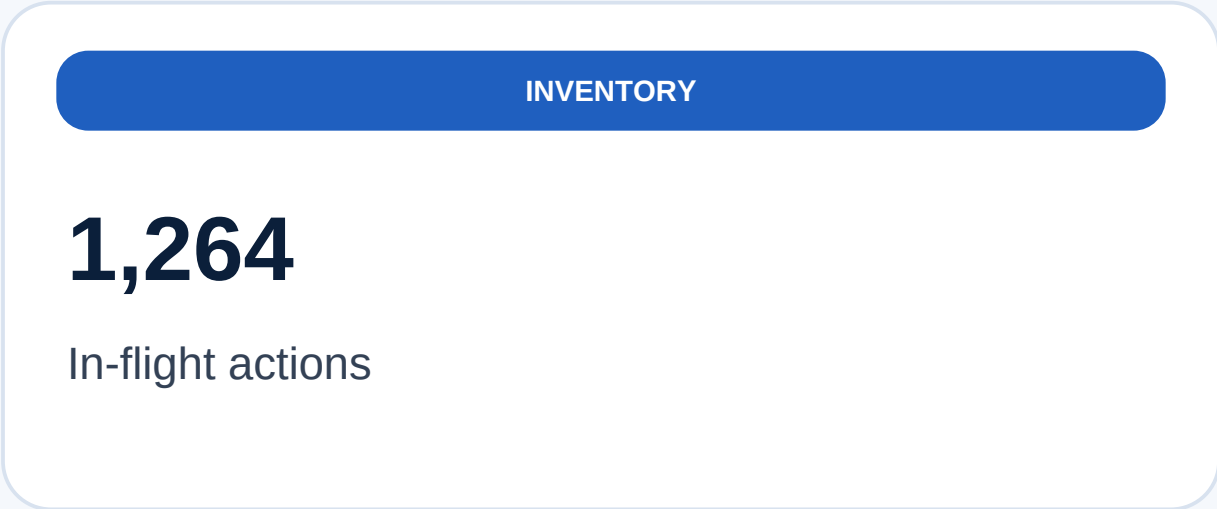

CONTROL CONTRACT

Stopping new authority and establishing business truth are different clocks.

Containment ends only when every effect has a disposition

The modeled stop path fits 90 seconds, but local enforcement still breaches

DECISION RULE

Fence every effect boundary, then reconcile committed, cancelled and unresolved actions separately.
