

Benchmark accuracy is not production authority

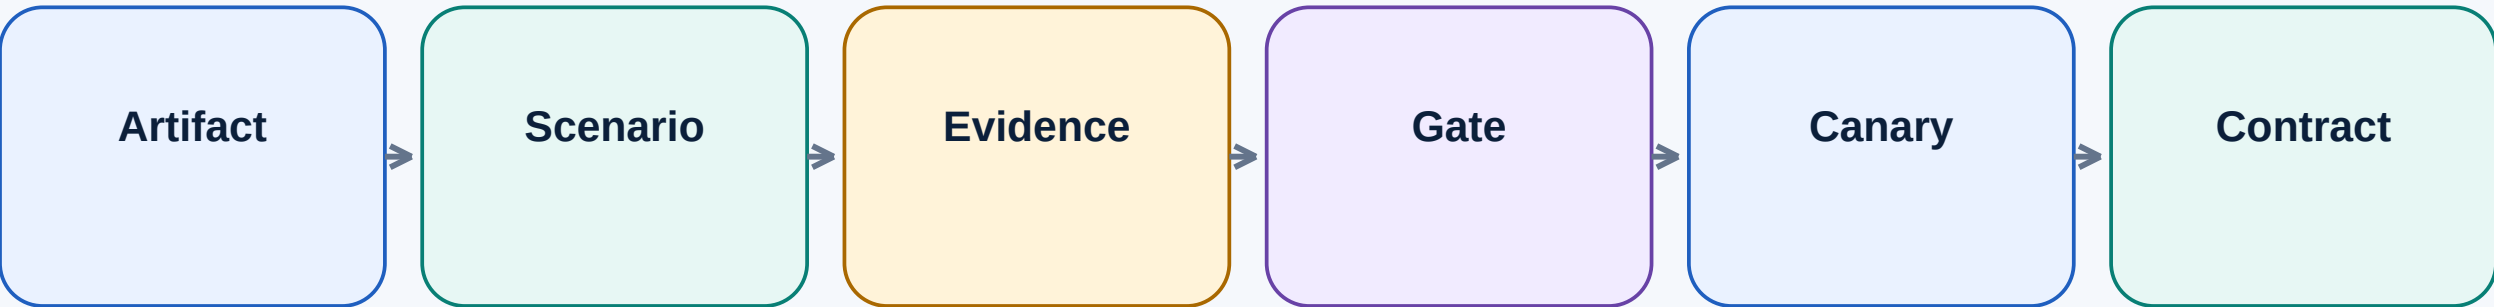

Promote the deployable system, not an isolated model score.

THE OPERATING NUMBER

92.6% -> 85.6%

Point estimate versus 95% Wilson lower bound for 88 successes in 95 cases

CONTROL PATH

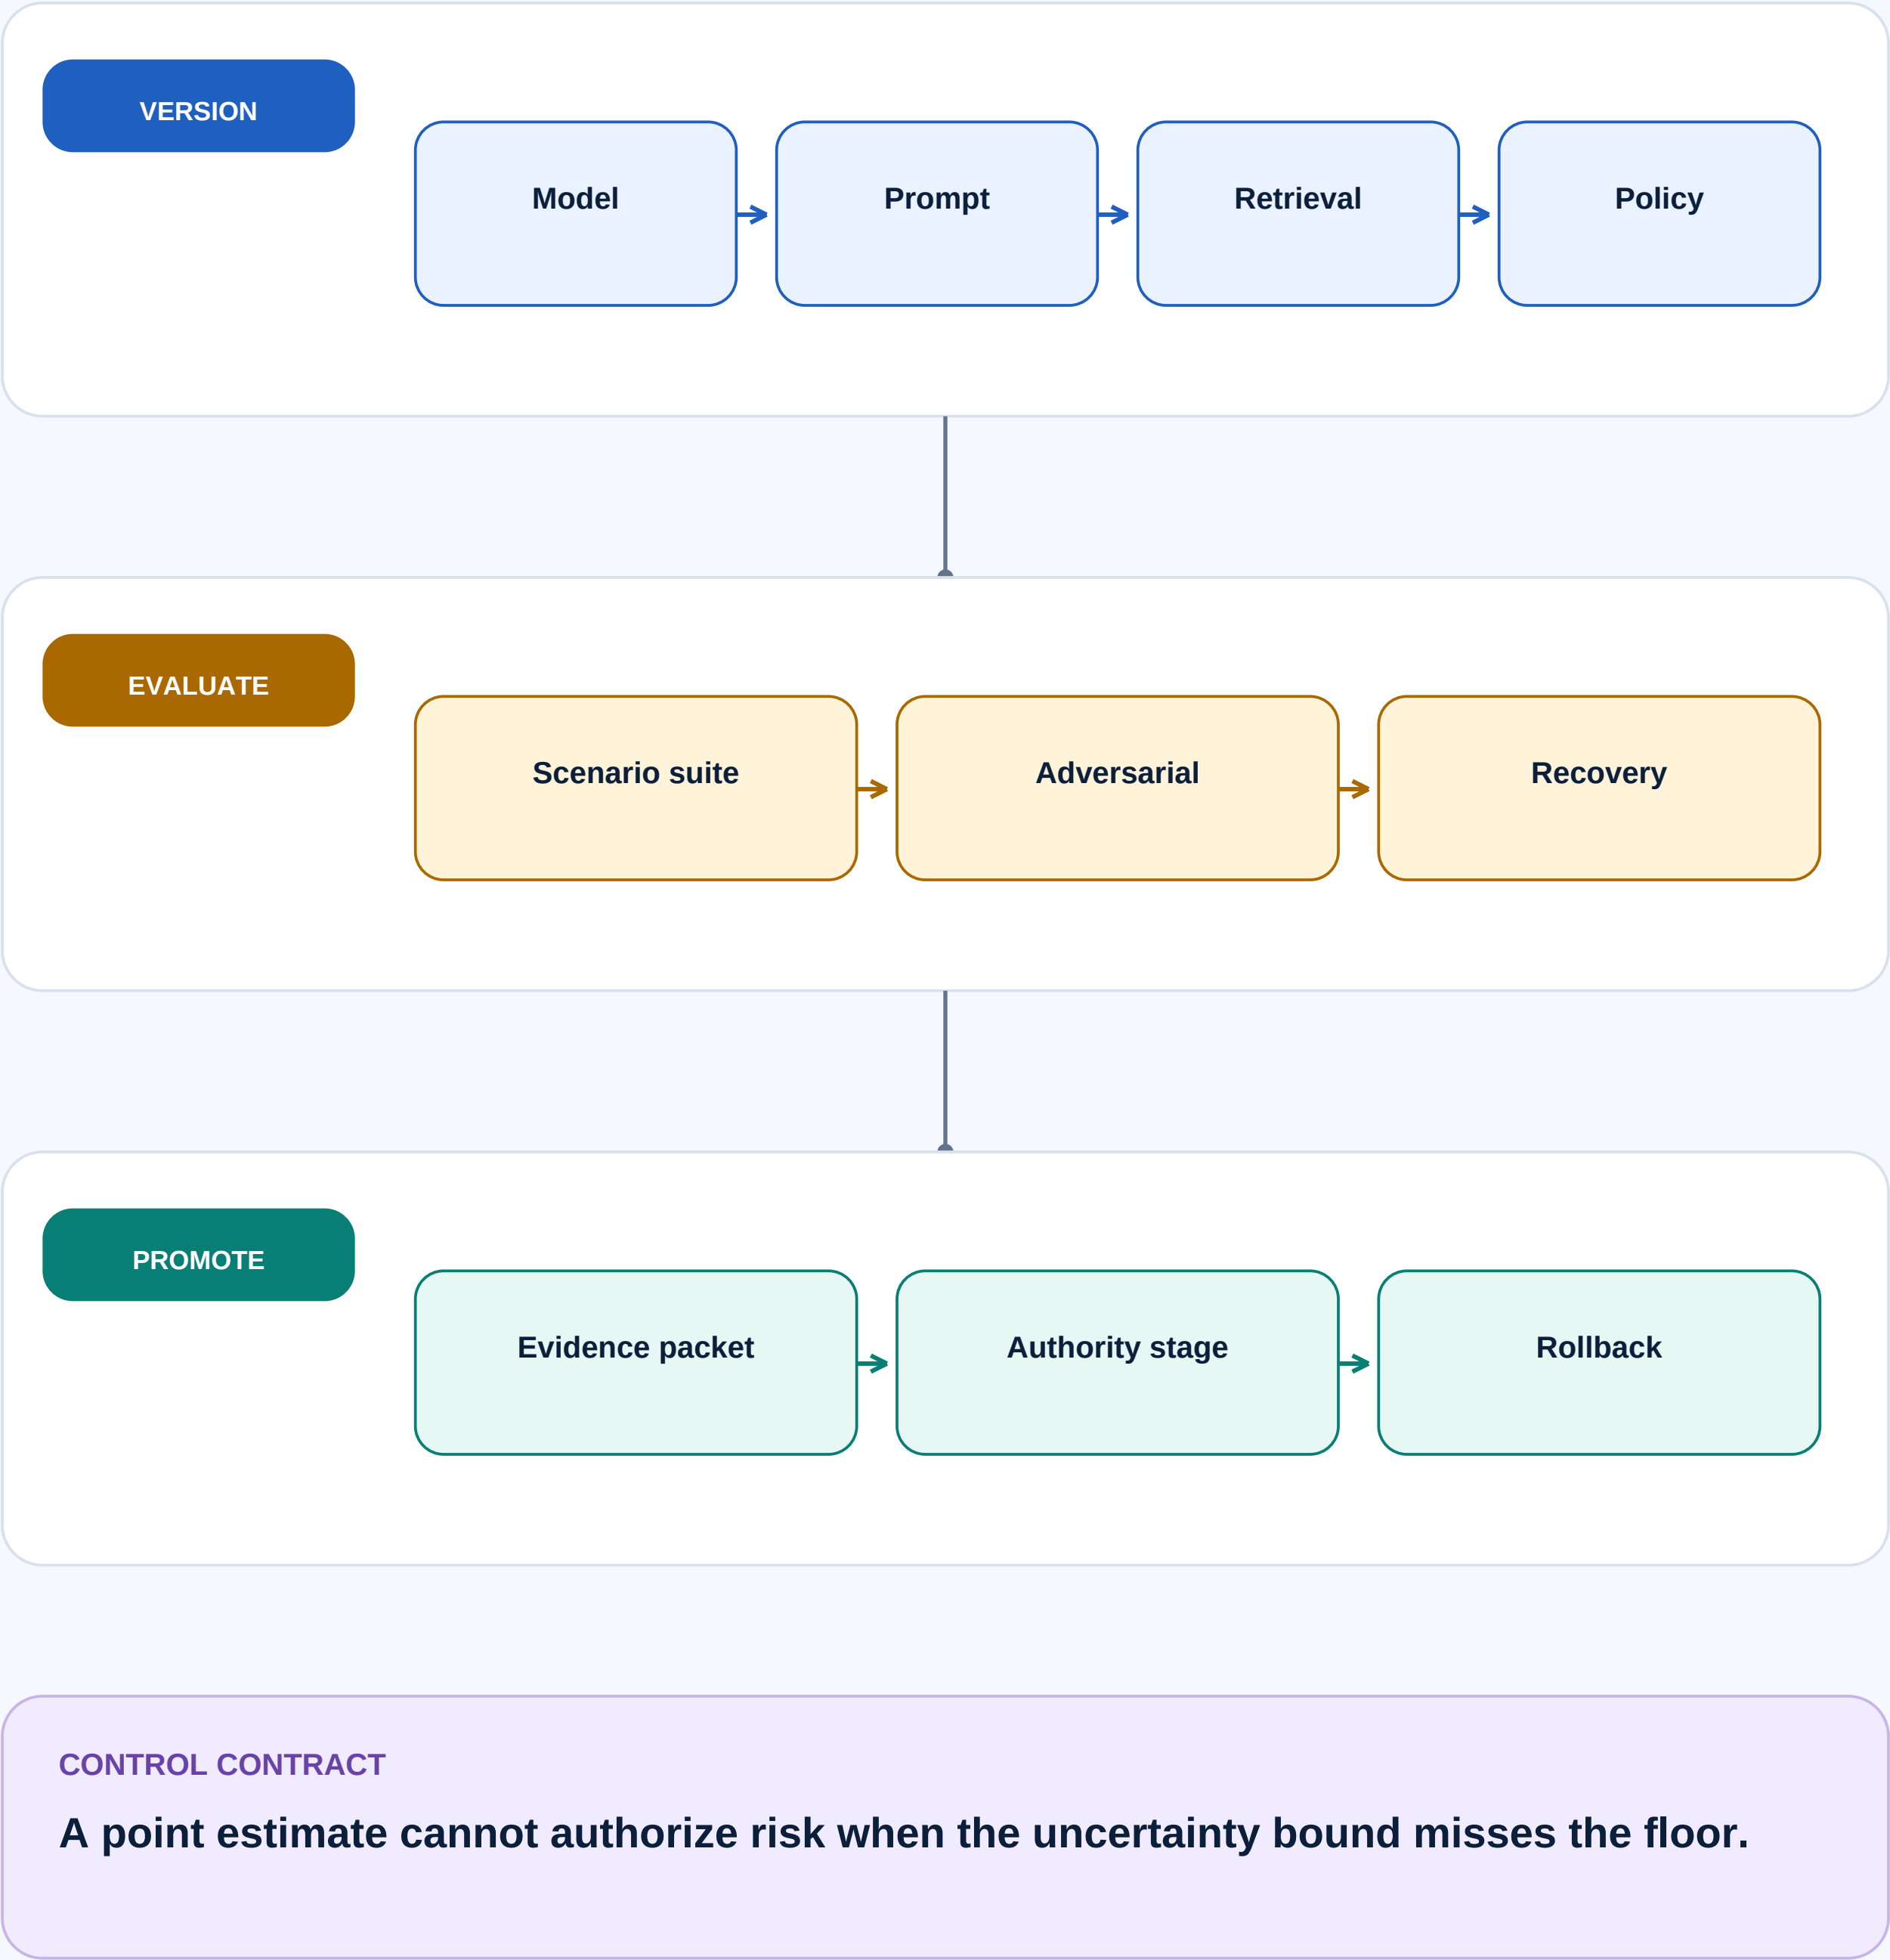

DESIGN PRINCIPLE

A point estimate cannot authorize risk when the uncertainty bound misses the floor.

Production Evaluation control architecture

Explicit planes separate decision, authority, execution and proof.

Zero observed failures is not zero risk

The rule of three gives an approximate upper failure rate of 3/n

Authority stages

DECISION RULE

Expand authority only when cohort evidence, uncertainty and recovery gates all pass.
